

Connecting drainprosn.com to the website

Everything on the Vercel side is already done. All that is left is adding two records in GoDaddy. About 10 minutes of work, then some waiting. You do not need to understand DNS - just copy the two boxes below exactly.

The whole job, in one box

Add these two records in GoDaddy. That is it. Everything else in this document is explanation, checking, and what to do if it does not work.

Record 1 Type **A** Name **@** Value **216.150.1.1**

Record 2 Type **CNAME** Name **www** Value **bcfa489ffb8633ee.vercel-dns-016.com**

Two things worth knowing before you start

The website address is already registered and already set up in Vercel. Both drainprosn.com and www.drainprosn.com are showing "Invalid Configuration" right now, which is normal and expected - it just means the GoDaddy side has not been done yet.

The domain will show whatever is on the main branch. The newest work is on a branch that has not been merged yet, so the live domain may show an older version of the site until it is merged. That is a separate job from this one and it is ours, not yours.

Part 1. Open the DNS page in GoDaddy

1. Sign in to GoDaddy

Go to **godaddy.com** and log in.

2. Find the domain

Click your name in the top right, then **My Products**.

Scroll to **Domains** and find **drainprosn.com**.

3. Open DNS management

Click the three dots next to the domain, then choose **Manage DNS**. On some accounts there is a **DNS** button instead - either one gets you to the same page.

You should now see a list of records with columns headed Type, Name, Value, and TTL.

Part 2. Clear the GoDaddy placeholder records

GoDaddy puts a parking page on every new domain. Those records have to go, or they will compete with the new ones.

4. Delete the existing A record

Find the row where **Type** is **A** and **Name** is **@**. Delete it, using the pencil or bin icon at the end of the row.

Why: Two A records for the same name send visitors to two different places at random. There must only ever be one.

5. Delete the existing www record

Find the row where **Type** is **CNAME** and **Name** is **www**. Delete that one too.

6. Leave everything else alone

Do not touch any row marked **MX**, **TXT**, **NS**, or **SOA**. Those do other jobs and deleting them causes problems that are annoying to undo.

Part 3. Add the two Vercel records

7. Add the A record

Click **Add New Record** and fill it in exactly like this:

Type	Name	Value	TTL
A	@	216.150.1.1	1 hour

The @ in the Name box means the domain on its own - drainprosn.com with nothing in front of it. If GoDaddy will not accept @, leave the Name box empty instead; on some accounts that means the same thing.

8. Add the CNAME record

Click **Add New Record** again and fill it in exactly like this:

Type	Name	Value	TTL
CNAME	www	bcfa489ffb8633ee.vercel-dns-016.com	1 hour

That long value is specific to this website - it is not a generic address and it will not match anything you find online. Copy it character for character. Do not add "https://" and do not put a dot on the end.

9. Check for domain forwarding and turn it off

Still in GoDaddy, look for a **Forwarding** section on the domain page. If there is a forwarding rule set up, remove it.

Why: Forwarding overrides everything you just did and sends visitors somewhere else. It is the single most common reason a correctly configured domain still does not work.

10. Save, then stop touching it

Save your changes and close the page.

Why: DNS changes spread across the internet on a timer. Editing again restarts that timer, so the fastest thing you can do now is nothing.

Part 4. Check that it worked

11. Go back to Vercel

Open **vercel.com**, go to the **drain-pros-tn** project, then **Settings** and **Domains** - the same screen you were on before.

Click **Refresh** next to each domain.

12. Look for the green tick

Within roughly 10 to 60 minutes, the red **Invalid Configuration** label should become a green **Valid Configuration** on both entries.

It can occasionally take a few hours. That is normal and there is nothing to fix while you wait.

13. Open the site

Type **drainprosth.com** into a browser. You should land on the Drain Pros TN website, with the address bar showing **www.drainprosth.com** and a padlock.

Why: The padlock means the security certificate is live. Vercel issues that automatically and free, usually within minutes of the DNS being right. There is nothing to buy.

If it has been more than a few hours

1. Check that GoDaddy Forwarding is off. This is the usual culprit.
2. Check there is only ONE A record for @, and its value is **216.150.1.1**.
3. Check the www CNAME value has no "https://" and no dot on the end.
4. Try the site on your phone with wifi switched off. Home routers remember the old answer far longer than the rest of the internet does, so it often works everywhere except your own house.
5. Compare what is on screen against the two boxes on page 1, character by character. It is almost always a typo.

Part 5. Tell us when it is live

One thing still has to happen in the code, and it is our job rather than yours.

The website does not yet know its own address. Until it is told, every page still refers to a placeholder address in the invisible data that Google reads - so search engines would see a site pointing at an address that does not exist. It is a one-line change:

config/business.ts -> **IDENTITY.domain**

It is the last unconfirmed item in the entire build. Once it is set, the web addresses, the sitemap, and the structured data across all 94 pages resolve to the real domain automatically. Just message us that the domain is live and we will do it.

Two things NOT to do

Do not switch the nameservers to Vercel. The Vercel screen offers that as an alternative (ns1.vercel-dns.com and ns2.vercel-dns.com). It works, but it hands all DNS control to Vercel and makes email harder to set up on the domain later. The two records in this guide are the simpler and more reversible route.

Do not buy an SSL certificate from GoDaddy. Vercel issues one automatically and free. Anything GoDaddy offers to sell for "website security" at checkout is not needed here.

Values in this guide were taken from the Vercel Domains screen for this project on 17 August 2026. If Vercel ever shows something different from the boxes above, Vercel is right and this document is out of date.
